

ABSTRACT

LEGAL AI SYSTEM

The “**Legal AI System**” is an AI-powered legal assistance platform designed to make legal services more accessible to people in India. It analyzes legal queries, classifies case types, and retrieves relevant laws using **RAG** and **FAISS**-based semantic search. The system finds similar court judgments and legal precedents through AI-powered case retrieval. It uses multiple AI agents to provide legal guidance, evidence requirements, cost estimates, court information and finds suitable advocates based on their location and case type. Users can generate complaint letters and downloadable legal PDFs directly from their case details. This project bridges the gap between citizens and the legal system by providing AI-driven legal assistance for informed decision-making.
